CNRS

Outline of the presentation

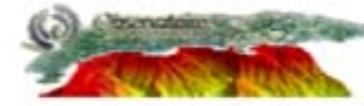

- Historical context
- Instruments overview
- Solar diameter measurements SODISM2
- Refraction effect → correction
- Seeing effect → MISOLFA
- Other (aerosols, ...)

Context of the project

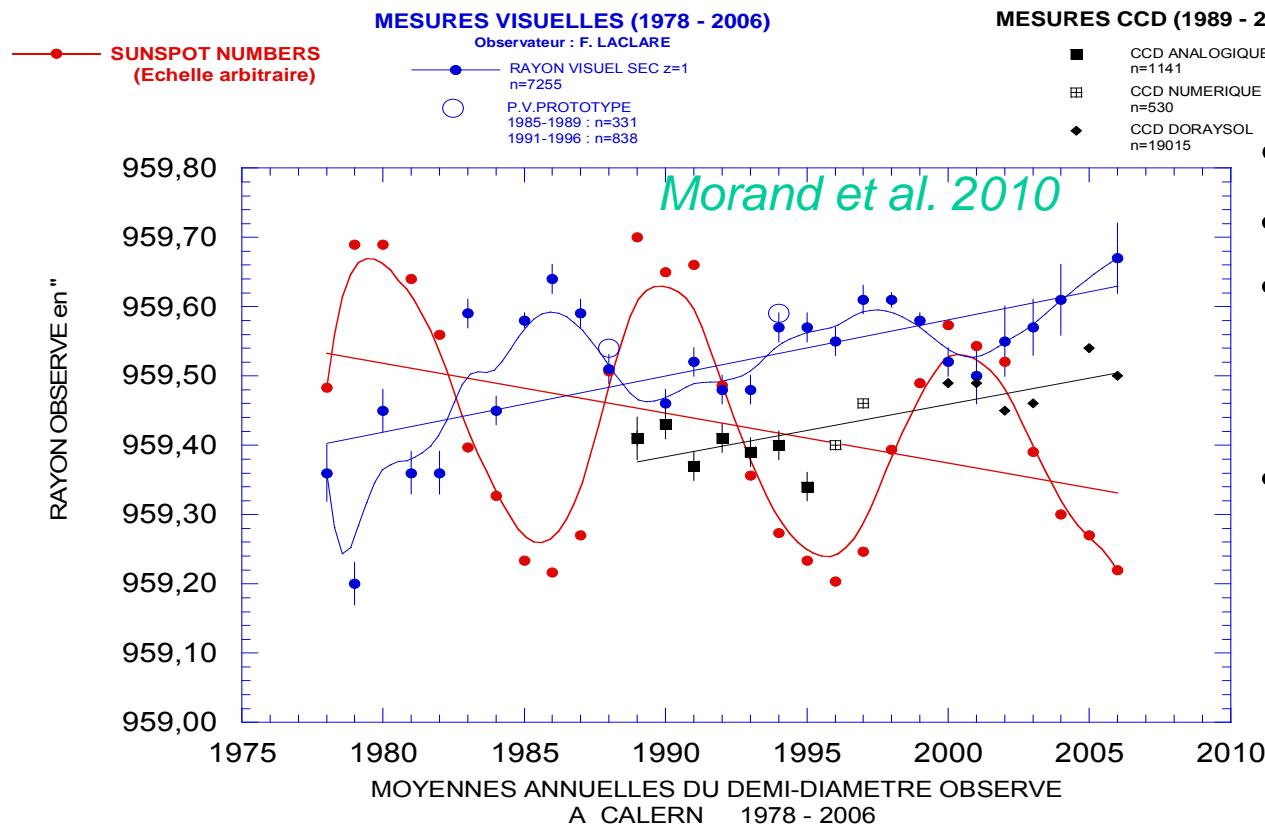

Emilio et al. 2012, Meftah et al. 2013, Sofia et al. 2013

Introduction

Diameter measurements by astrolabes 1978-2006

- 28 years of observations
- ~30000 measurements
- ~200 mas variations anti-correlated with Solar Activity
- Coherent with SDS balloon flights but no confirmation from space observations so far

True solar variations ? Earth atmospheric effects (possibly triggered by Solar Irradiance variations)?

PICARD-SOL objectives

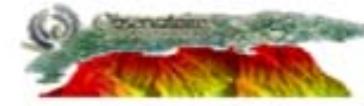

- To continuously and simultaneously record radius, optical turbulence and global atmospheric parameters at different wavelengths
- To understand the influence of the atmosphere on the solar radius measurements
- To compare the solar radius measurements obtained with SODISM-II and other ground based and space instruments
- To continue solar radius measurements with ground based instruments after the space mission

Exposure time

10 s

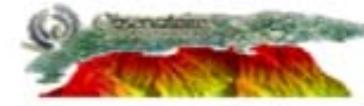

PICARD-SOL calibration steps and first results

- Plate Scale (stars observations)
- Flat-fielding
- Astronomical refraction corrections
- Images quality and selection
- First results
- Optical turbulence effects
 - Simulations
 - MISOLFA measurements
 - Application to the mean radius

dérouler les frontières

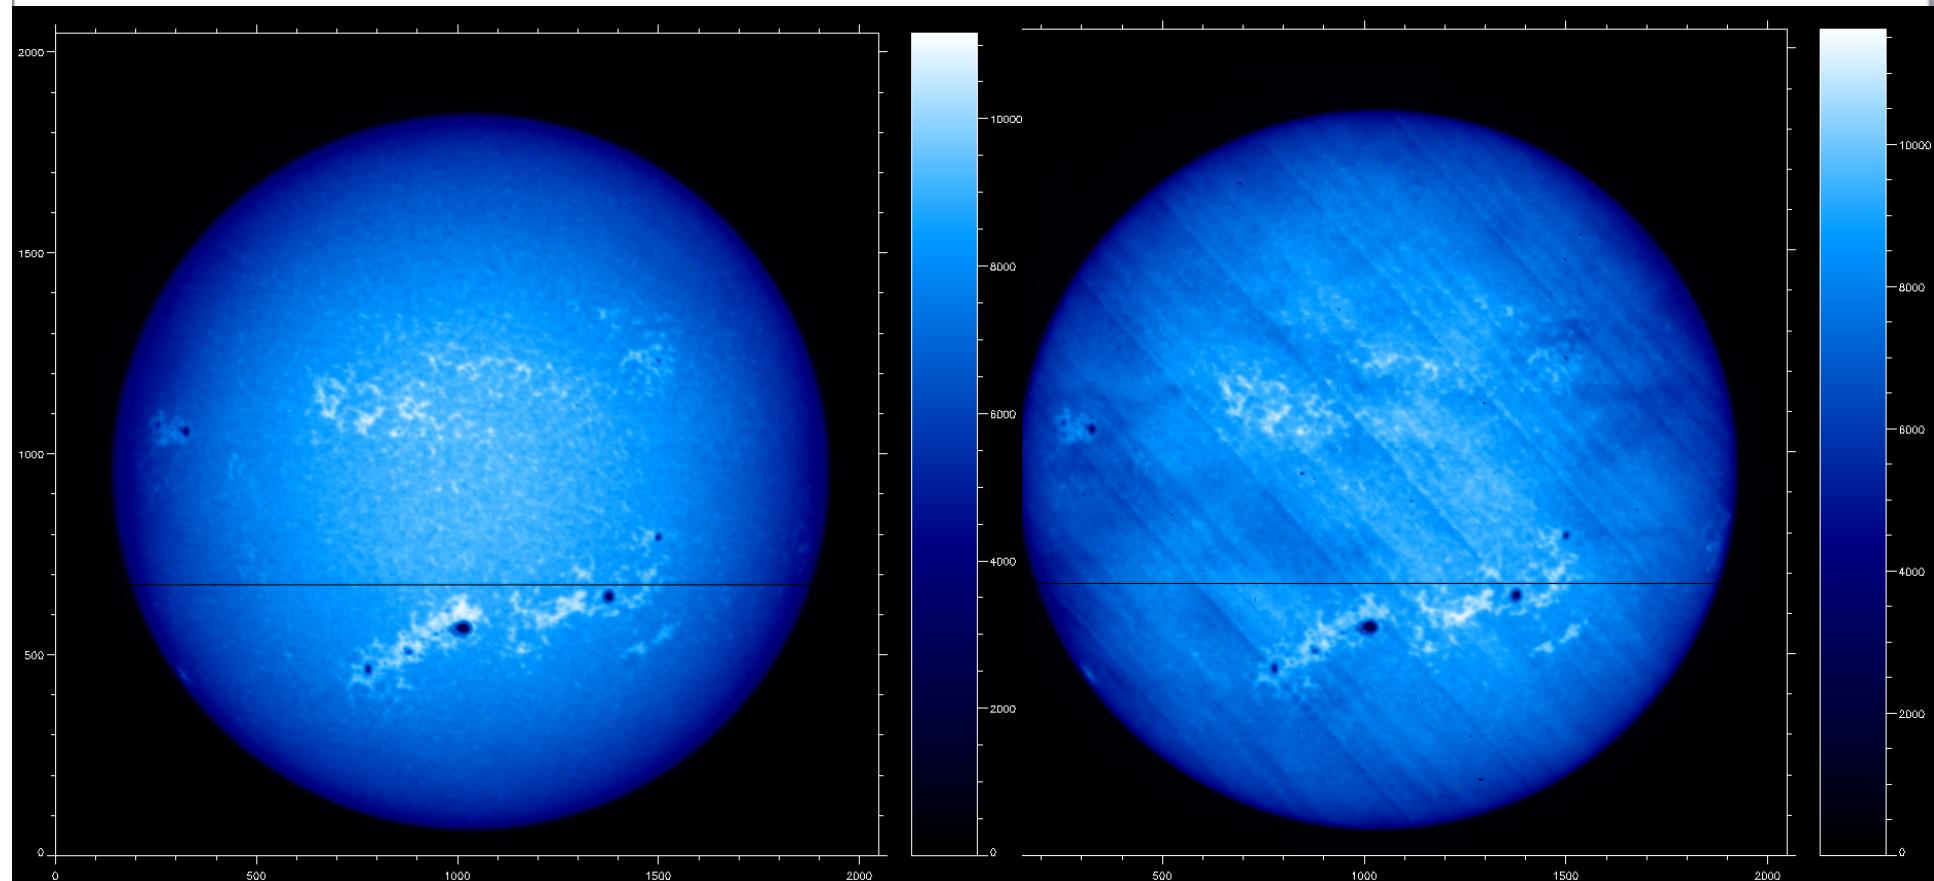

Flat-Field procedure

- Several methods are commonly used for Flat-fielding: Flat box, illuminated screen (domeflats), skyflat or twilight flat.
- Because of the entrance window we can not use these methods
- Solution: use of relatively shifted images (almost the same observational conditions) -> Kuhn method (*Kuhn et al. 1991*)
- SODISM-II acquires one image/minute -> very difficult to have a good flat-field (need of good and stable conditions).
- A new method based on contrast map is tested.

Flat-Field corrections contrast map method

393 nm

Data processing

Pupil plane

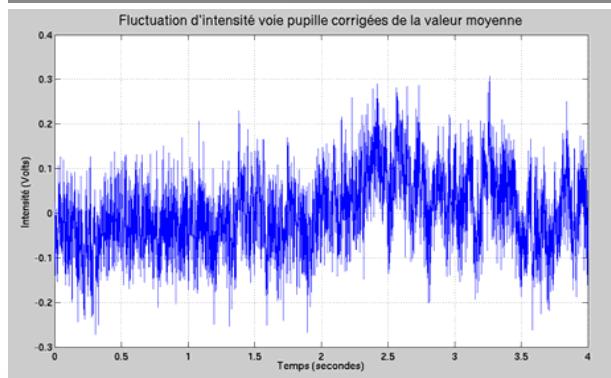

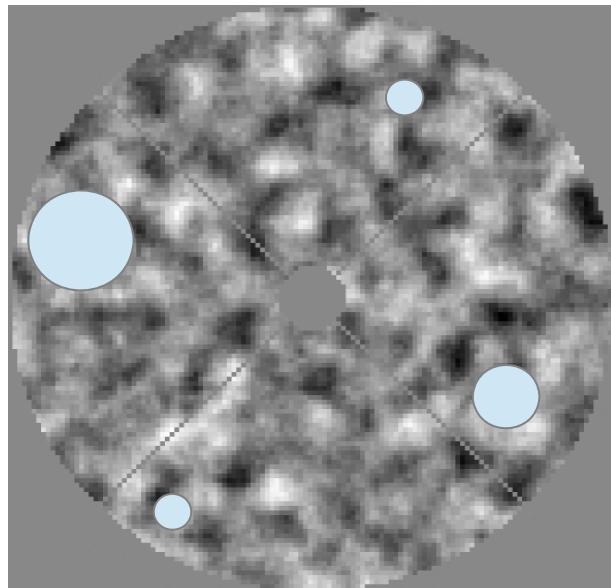

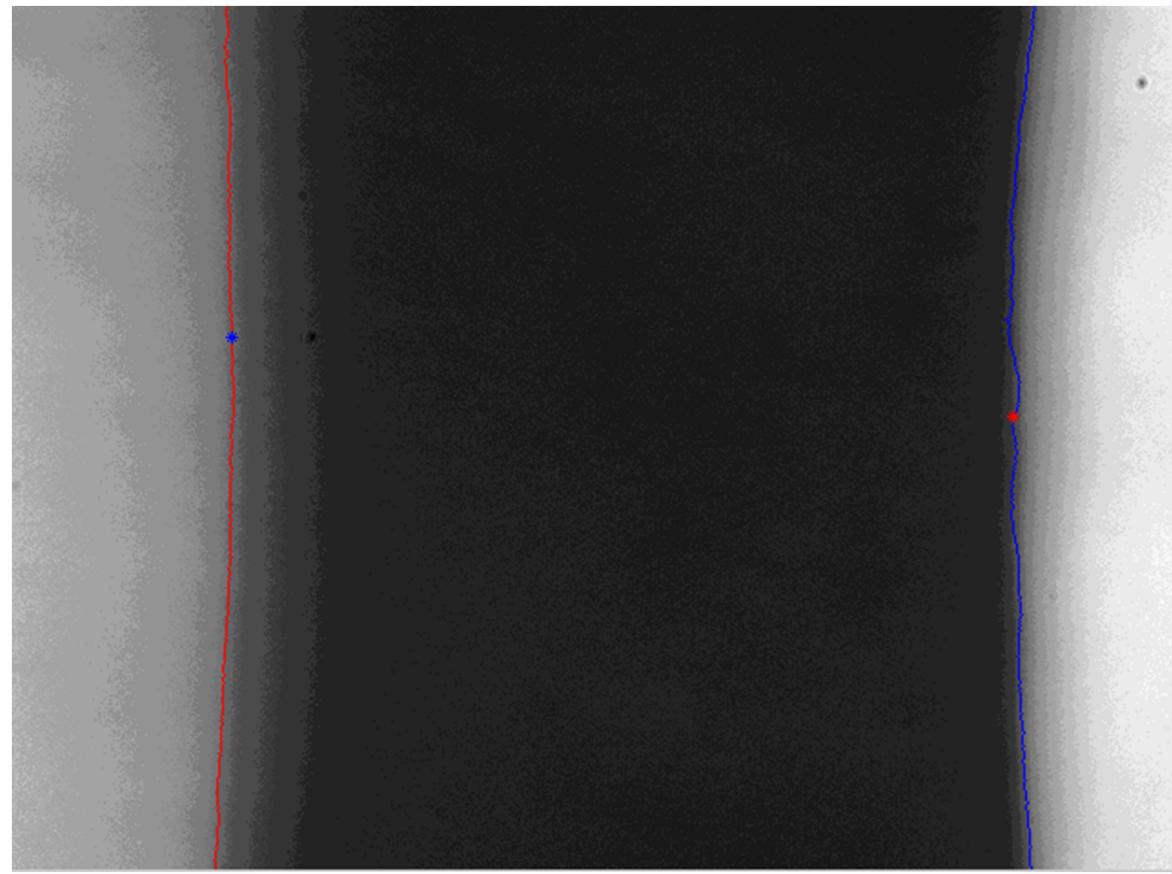

Image plane

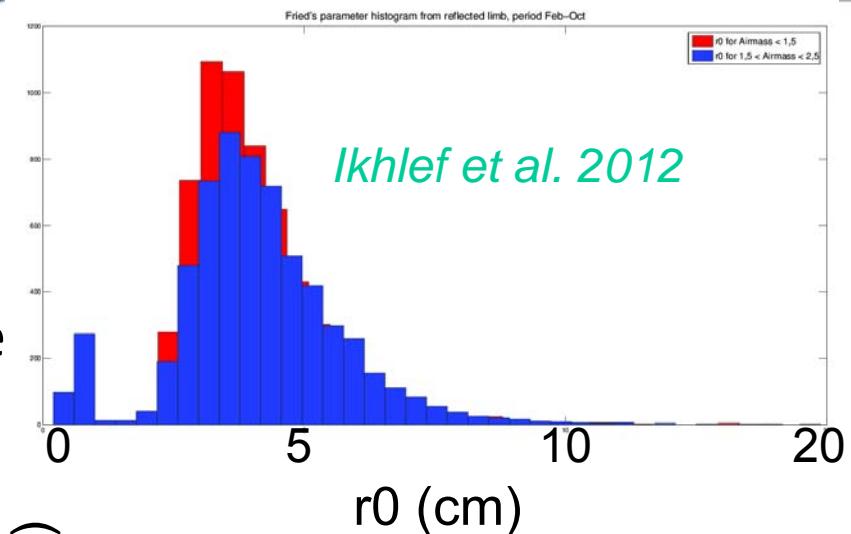

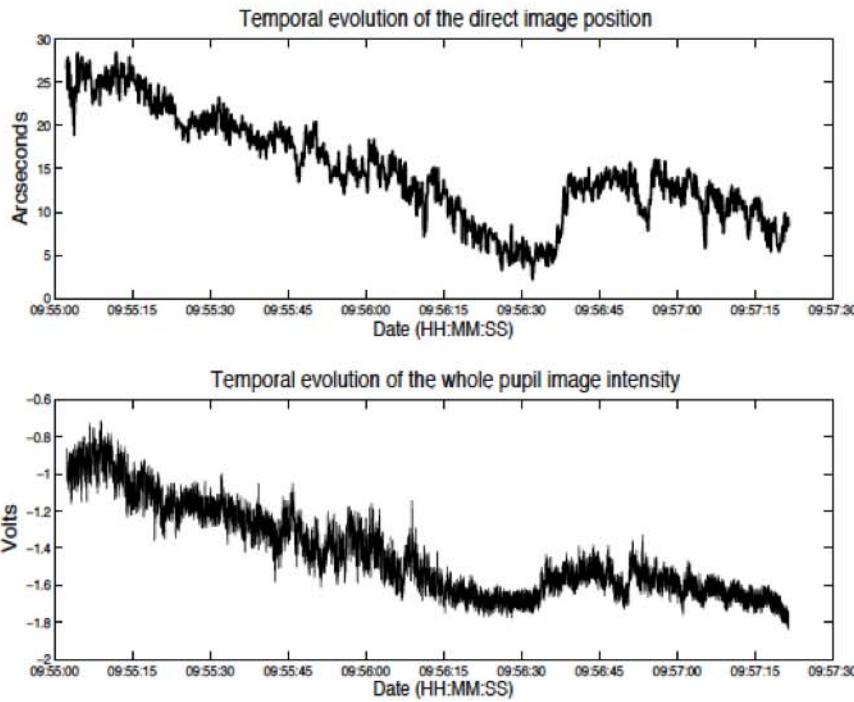

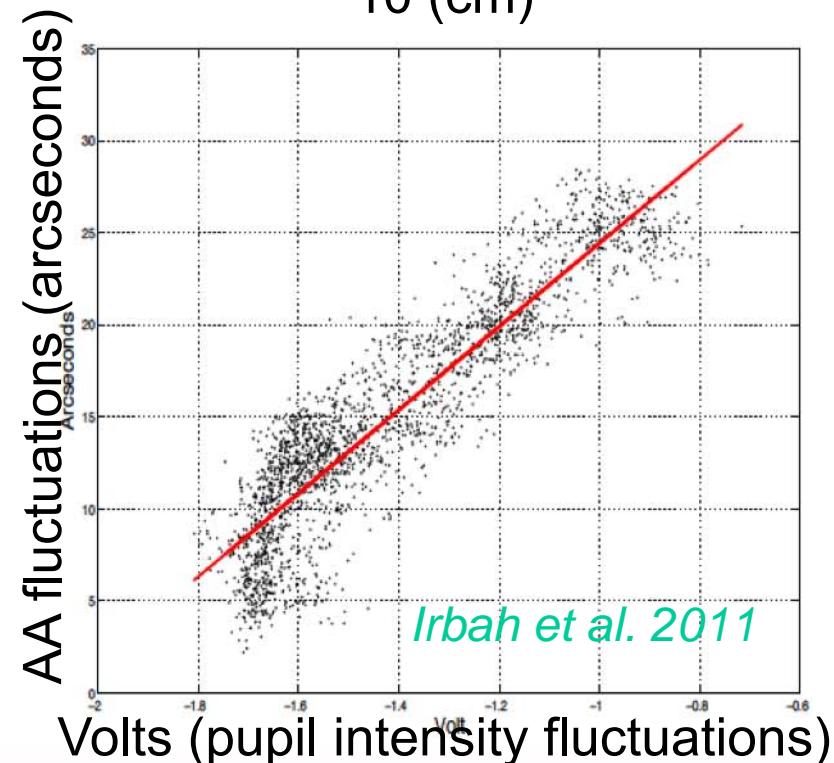

Results

Mesurements : MISOLFA

- Statistics r0: median value **3,86 cm**
- First results from pupil plane observations (characteristic time)

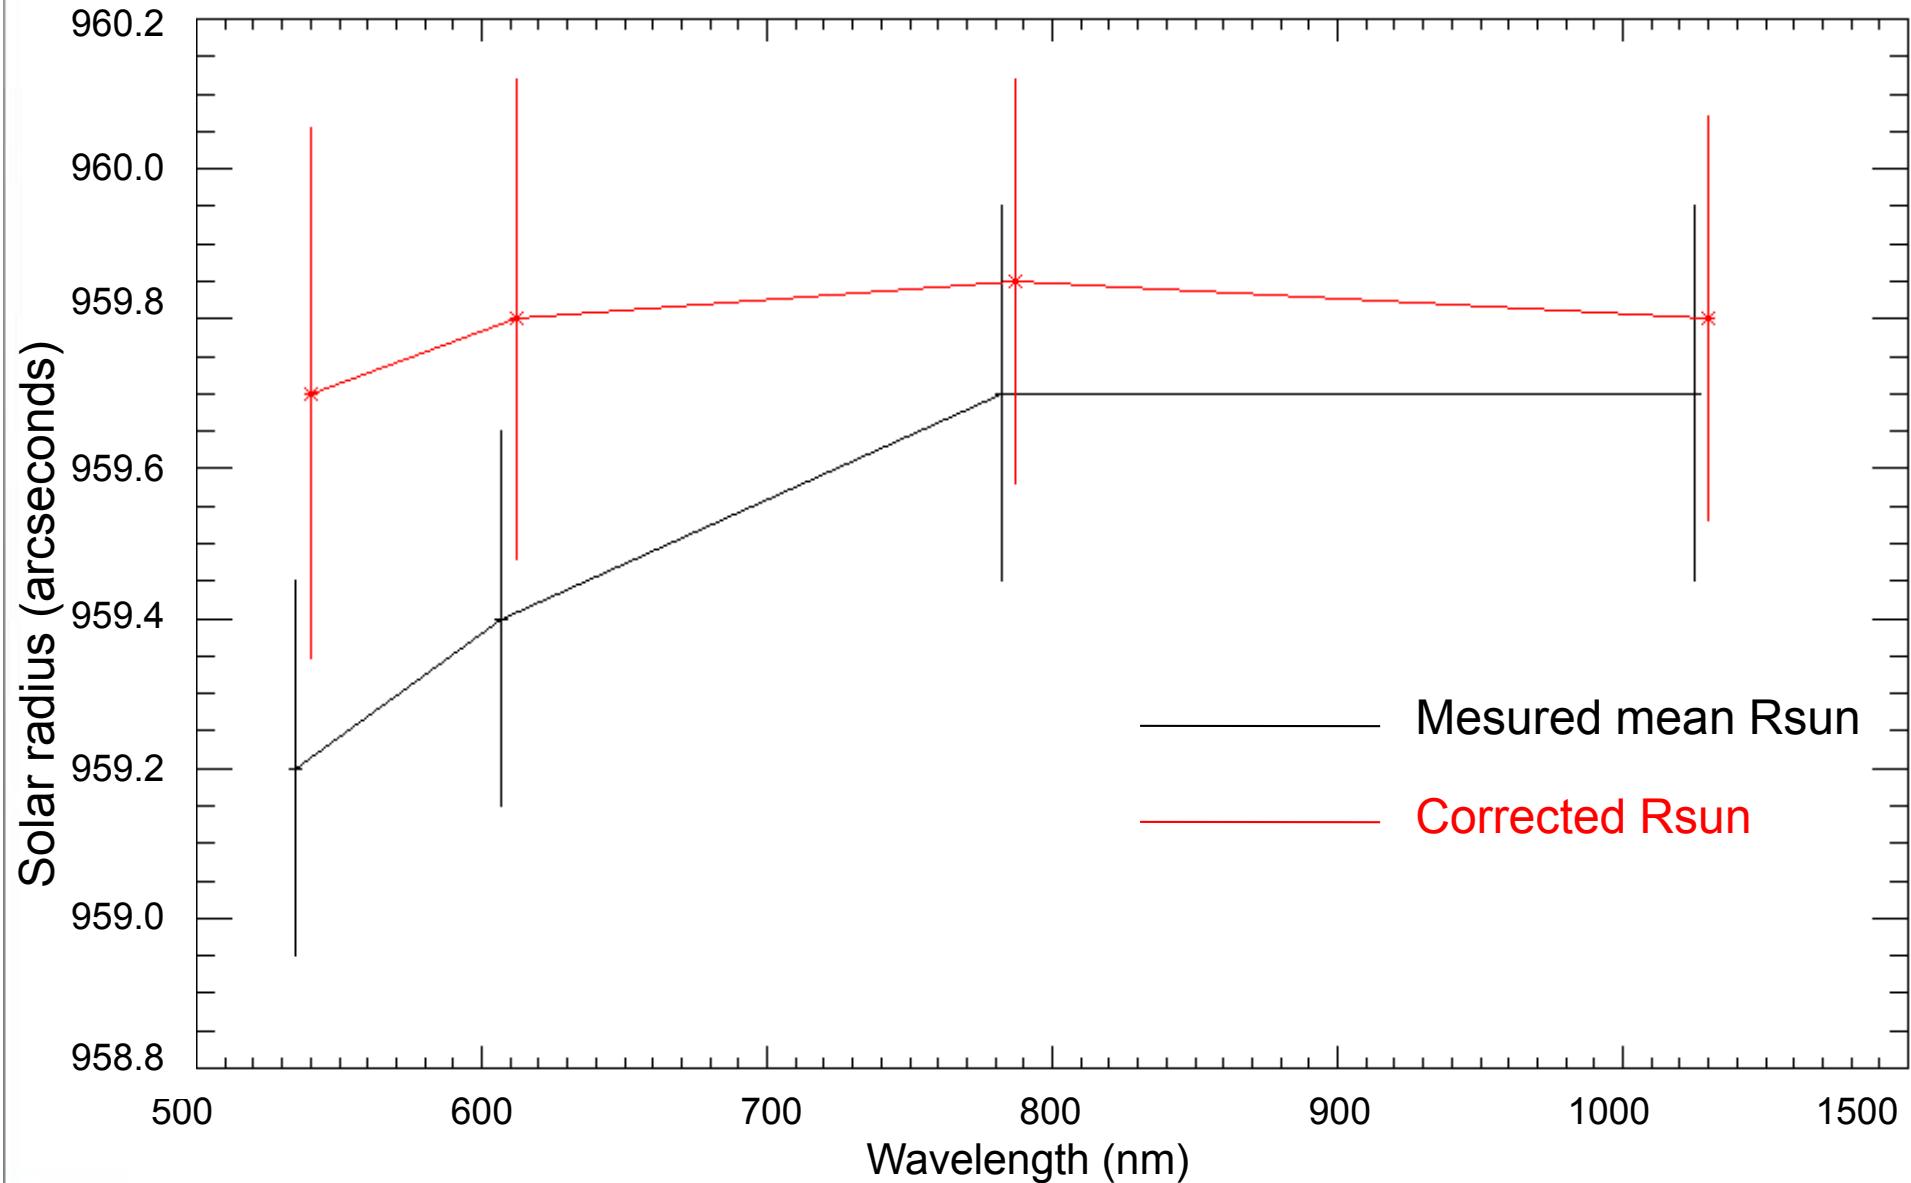

Ikhlef et al. 2012

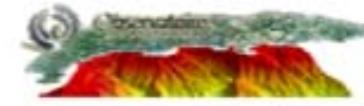

Irbah et al. 2011

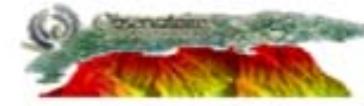

Correction on measured diameters

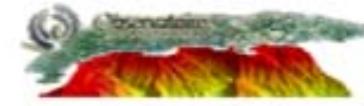

Conclusions and perspectives

- After 2,5 years of observations, we have a very good instrumental stability
- No significant trend in solar diameter detected so far
- About 200 mas of dispersion at the different wavelengths after astronomical refraction corrections
- Wavelength dependence partially explained by the bias introduced by optical turbulence
- Need a more complete exploitation of simultaneous observations SODISM-2/MISOLFA.
- Calibration of MISOLFA measurements with other instruments (S-DIMM, MOSP, PBL ...)
